

QT #24: Non Linear Light Effects in a 5G World

Time is basically an illusion created by the mind to aid in our sense of temporal presence in the vast ocean of space. This space is filled with currents that connect things and change things in ways few of us realize. Those electrical current vary electron clouds in us to allow our cells to perceive time by creating it. Light comes to us in a timeless fashion and few of us realize it. To see the past we must slow light down by observing it in some way. Without our cells to slow light down to create a virtual perception from these waves, the past and the future based on all our experiences, there is no actual existence of the past and the future. All that there is, is the present. As crazy as this seems, the reality is, time is always standing still because light photons are timeless; we are only changing because the things in us slowly light down and then time emerges for us to perceive. It is an illusion of our mind built by nature because of quantum weirdness.

An alarm clock is shown floating in a turbulent, stormy ocean. The clock is partially submerged, with water splashing over its face. The background is a dark, stormy sea with white-capped waves and a cloudy sky. The overall mood is one of chaos and confusion.

Time floats in an ocean of confusion

Your mind is built to organize this chaos
