

REALITY #18: MITOCHONDRIC LESSON, WHAT THEY DIDN'T SAY MATTERS MORE

Who shall decide, when doctors disagree? A mitochondriac uses data as their discipline in deciding who might be correct.

Excellence in nature is a range of differences, and is never based upon a present moment of current belief. Disagreement is part of the world of science. I believe disagreement is “an evolutionary revolution” that leads to scientific change.

It happens all the time in true scientific meetings and no one gets upset about the arguments. Once they are done you go back and think about what each side says and you decide who is more right than wrong. In fact, I recorded a podcast this week with Kevin Cottrell that is not live yet at his site where I talk about this aspect of science and disagreement and how it is 180 degrees opposite of what we find at bio-hacking and technology conferences or on social media.
